

NAME

debugapp – A wrapper for openapp.

SYNOPSIS

debugapp [--find] [--gdb=...] *application* [*arguments...*]

DESCRIPTION

debugapp is a tool that helps you start or find applications by name in debugging mode. It acts as a wrapper around **openapp**, and calls openapp with the **--debug** option. By default gdb is used as the debugger, but this can be changed with the **--gdb=** option or through the **GDB** environment variable.

The *arguments* are the arguments passed to the application.

See the **openapp** (1) man-page for a complete description.

SEE ALSO

openapp(1)

HISTORY

Work on **debugapp** started in October 2006 by Nicola Pero <n.pero@mi.flashnet.it>.
